

FL-01 Workflow Audit

#	Recurring task	Classification	Why?
1	Learning AI/ML concepts and completing courses	Just me + Collaborate with AI	AI can explain concepts, create examples, and quiz me, but I need to understand and verify the material myself.
2	Writing and debugging Python code	Just me + Collaborate with AI	AI can help identify bugs and suggest solutions, but I must understand, test, and integrate the code.
3	Building AI/ML projects	Just me + Collaborate with AI	AI can assist with architecture, debugging, and documentation, while I remain responsible for technical decisions and implementation.
4	Researching datasets for projects	Collaborate with AI	AI can suggest relevant datasets and sources, but I need to verify quality, licensing, relevance, and suitability.
5	Data cleaning and exploratory analysis	Just me + Collaborate with AI	AI can generate starter code and suggest analysis approaches, but I need to validate the data and results.
6	Writing professional comments	Delegate to AI with review	AI can quickly generate drafts, but I review and personalize them so

			they reflect my actual voice and opinions.
7	Designing graphics and social media content	Just me + Collaborate with AI	AI can support brainstorming, copywriting, and concepts, while I make the final creative and visual decisions.
8	Working on the AI firefighting drone project	Just me + Collaborate with AI	The core engineering decisions, hardware integration, testing, and project ownership must remain mine, though AI can assist with research and troubleshooting.
9	PCB design and embedded systems work	Just me + Collaborate with AI	AI can explain components, review approaches, and help troubleshoot, but I must verify designs and test hardware myself.
10	Writing LinkedIn posts / professional content	Delegate to AI with review	AI can produce a solid first draft fast, saving real time, but the post represents my professional voice and claims , so I review and edit every version before it goes out publicly.
11	Applying for jobs and internships	Just me + Collaborate with AI	AI can improve my resume or application materials, but deciding which

			opportunities align with my goals and submitting truthful information is my responsibility.
12	Researching datasets for projects	Collaborate with AI	AI can quickly surface dataset options I might not find on my own, but licensing, data quality, and relevance to my specific project are things I have to verify myself , a wrong dataset choice can break a whole project downstream.
13	Writing and debugging Python code	Collaborate with AI	AI can spot likely bugs and suggest fixes faster than I can alone, but I still have to run the code, test edge cases, and understand the fix , otherwise I'm shipping code I can't explain or maintain.
14	Project planning and breaking work into tasks	Just me + Collaborate with AI	AI can help structure projects and identify missing steps, while I decide priorities based on actual constraints.
15	Final verification of project results and portfolio claims	Just me	I should not blindly trust AI generated conclusions; I am

			responsible for verifying that results and claims are accurate.

interpretation?

Performance Discernment: How does Claude communicate its thinking?

Is it clear? Does it ask good questions? Does it build on your suggestions effectively?

More game suggestions

Continue developing your Description and Discernment skills through these activities:

Twenty Questions: Have Claude think of an object, person, or concept, then try to guess it by asking yes/no questions. Then switch roles. Notice how you each formulate questions and provide clues.

Collaborative Storytelling: Start a story with one sentence, have Claude continue with another, and alternate back and forth. Observe how you both maintain narrative coherence and build on each other's ideas.

A Wizard Approaches You in the Tavern: If you enjoy playing role playing games, try playing a game or two with a language model as either player or game master.

Concepts & Constraints: Choose a complex concept and really tight

Projects / AI Fluency Internship

AI Fluency Internship

I am completing an 8-week AI Fluency internship focused on learning how to collaborate with AI effectively, efficiently, ethically, and safely. I want to improve my AI/ML, data, software, and engineering skills while building practical projects and a stronger technical portfolio. I want this project to help me learn, critically evaluate AI outputs, improve my workflows, and complete my internship assignments.

Target Task 1: Writing and debugging Python code

Done well means: The code works correctly, I have personally tested it, and I understand why the fix works well enough to explain or reuse it without AI.

Target Task 2: Researching datasets for AI/ML projects

Done well means: I compare at least two relevant options, verify their quality, licensing, and relevance myself, and can justify my final choice with reasoning that isn't just AI's opinion.

Target Task 3: Writing LinkedIn posts and professional content

Done well means: The final post is accurate, sounds like my own voice, and takes noticeably less time than writing it from scratch , while I still reviewed and edited every claim before posting.
